

### **Code To create Session:**

#### **Syntax:**

```
request.session['key'] = value
```

#### **Example:**

```
request.session['username'] = u_email(can be any variable)
```

### **Code to retrieve data from session:**

#### **Syntax:**

```
if request.session.has_key('key'):
    uname = request.session['key']
```

#### **Example:**

```
uname = None
if request.session.has_key('username'):
    uname = request.session['username']
```

### **Steps to use Session:**

1. Login First by using credentials
2. if credentials are valid then create session using code
3. else No Session will be created.

#### **Note:**

- Session can store any data from user's information. e.g Username/email/id.
- It depends upon the demand of project and can use the same data through out the project by retrieve from session.
